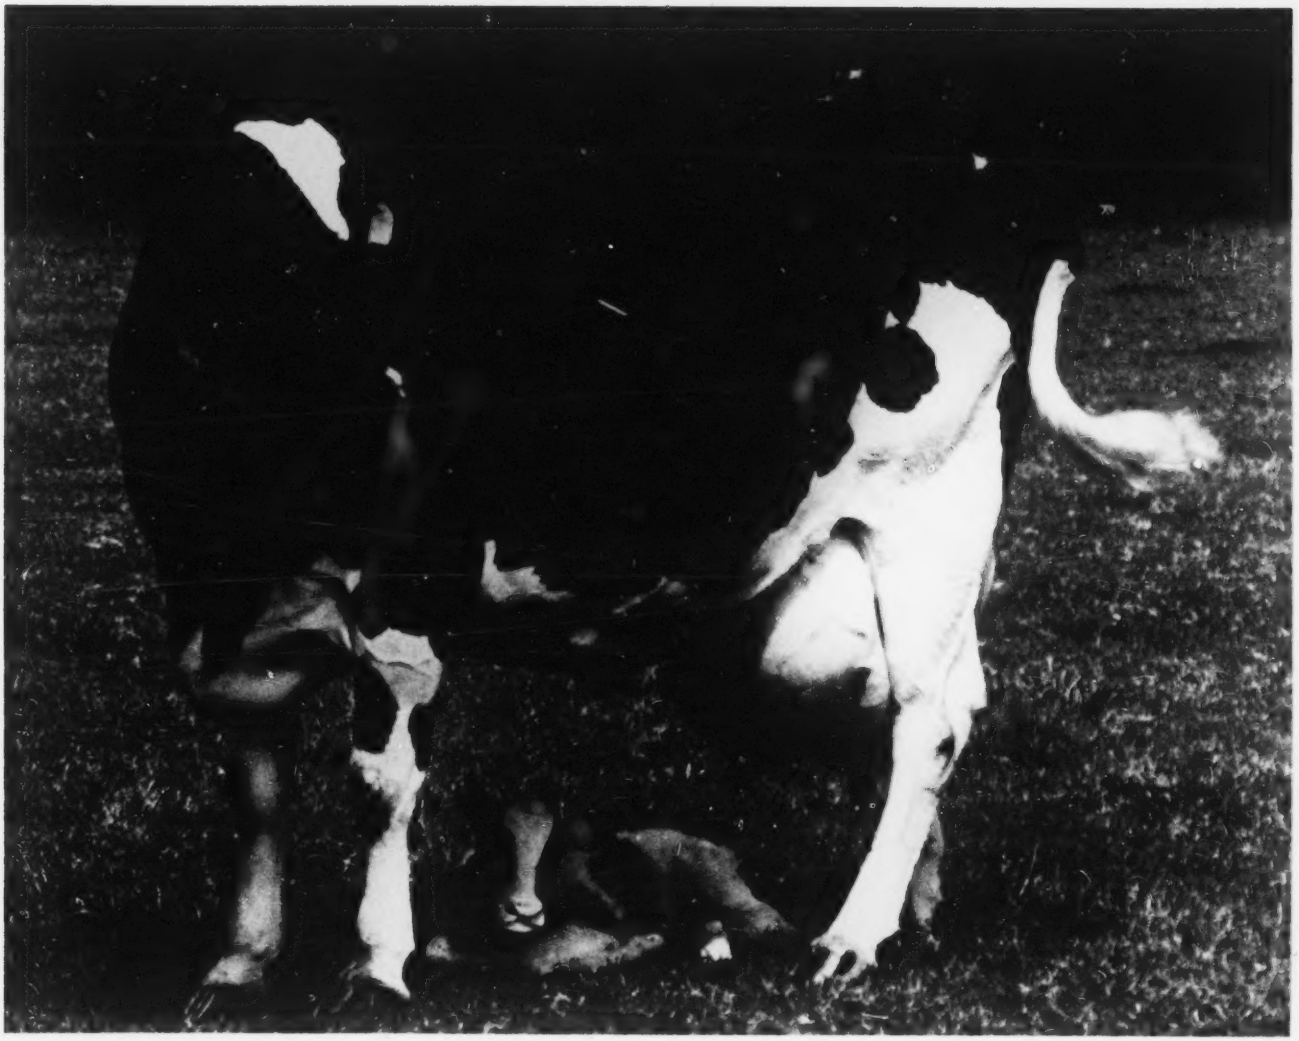
Georgia Agricultural Facts



1986 Edition

MESSAGE FROM THE COMMISSIONER

Dear Fellow Georgians:

As the level of awareness of agriculture's impact increases, Georgia Agricultural Facts becomes a more valuable tool for farmers, agribusinessmen, economists, journalists, decisionmakers and others interested in the trends in crop and livestock production. Information in this edition will indicate the continued diversification and dedication of Georgia farmers as they create new markets and compete for old ones.

In 1985, Georgia farmers weathered a number of onslaughts of adversity from Mother Nature -- late freezes, drought and the devastation of Hurricane Kate. The combination of the three bouts with the weather led 133 Georgia counties to be named an agricultural disaster area. Yet in many areas of production, farmers came close to record-setting yields, their determination unwavering. The plight of farmers facing financial hardships across the nation headlined newspapers and news broadcasts, bringing the awareness of farmers' problems to the attention of more people than ever before. As farmers prepared to face another year, the certainty that Americans were at least aware of their problems was an indication of support for their labors.

This publication, produced under a cooperative agreement with the National Agricultural Statistics Service, U.S. Department of Agriculture, and published by the Georgia Department of Agriculture, is dedicated to farmers and farm families, whose perseverance is for them a way of life and a necessity to their business. We trust that Georgia Agricultural Facts will serve you well.

Sincerely,

Tommy Irvin

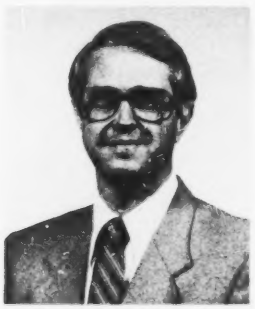
FOREWORD

As agriculture continues to operate in a complex arena affected by numerous outside influences, demand for information continues to increase. Statistics are of extreme importance to obtain a true picture of the current agricultural situation. Statistics show us where we have been, where we now are and what we might expect in the future. To meet any problem effectively, considerable assistance can be gained from a knowledge of historical facts. It is for these reasons that we are pleased to present this 1986 edition of Georgia Agricultural Facts.

This State-Federal agency has been a key cog in the Georgia agricultural information system since the early 1900's and has provided much of the basic statistical data used by producers, either directly or indirectly, to make their management decisions. The analysis and interpretation of these basic statistics are often performed by others, such as universities, other government agencies, private economists and the producer himself. Our role of providing the basic data is not taken lightly and every effort within available resources is made to provide an accurate and timely product beginning with survey design and continuing through data collection, summarization, analysis and finally the release of each crop and livestock statistic.

Data in this edition are keyed to the 1985 production year and include state and county facts for most major commodities. Estimates prepared are based on actual surveys designed to provide state estimates within a five percent error margin. As a convenience to users, some data series prepared by others are reproduced in this publication with credit to the preparer.



We are continually indebted to thousands of voluntary reporters from the Georgia farming and agribusiness community. Each reporter gives his time and effort to report various information that relates to his farm and business activities. Without this voluntary cooperation, it would be impossible to make reliable estimates or compile this publication. Thank you for your continued cooperation and support. Your suggestions for further improvement of this annual publication will be appreciated.

Sincerely,

Larry E. Snipes
Statistician In Charge

CROPS

CROP HIGHLIGHTS

Weather extremes during 1985 again tested the farming skills of Georgia's crop producers. Record low and high temperatures, three hurricanes, and periods of both near drought and excessive wetness all created varying degrees of stress on the State's crops. Yields were surprisingly good for most row crops considering the many problems.

Record low temperatures in January were so severe that fruit and nut crops were damaged. Small grains and winter vegetables were also hurt during that cold wave. Early spring planting got off to a very rapid start during the first half of March, slowed after mid-month due to wet soils and picked up again toward the end of the month. April was a dry month which permitted faster than normal planting. Rain returned early in May, watering seeds that had been planted in dry soil earlier. The last part of May and the first half of June were very dry with record high temperatures compounding the problem in June. Many dryland corn fields suffered during that period and the State's pastures also declined rapidly. Relief came about mid-June in the form of fairly general rain and pasture and crop conditions improved until dry weather toward the end of the month again threatened damage. Over three-fourths of the State had moisture shortages on July 1, but July was a very rainy month and nearly half the counties had surplus soil moisture at the end of the month. The wet spell spilled over into the first half of August. It was probably this very moist July-August period that boosted yields. Hurricane Elena brushed the State near the end of August bringing more moisture. September and most of October were relatively dry, making it an excellent period for rapid harvest of peanuts, corn, and hay which minimized harvesting losses due to weather. That wasn't true for soybeans that were not harvested by mid-October because the latter half of October and most of November were very wet. Temperatures were record high for November, which encouraged rapid deterioration of unharvested crops. The latest hurricane of record visited the State during the third week of November. Hurricane Kate slashed across south Georgia, catching part of the cotton, pecan, and soybean crops still unharvested, inflicting heavy damage in some localities. The wet conditions also caused considerable delays in seeding of small grains for the 1986 crop.

PEANUT CROP SECOND LARGEST

Georgia's 1985 peanut crop was the second largest crop ever produced in the State, despite a significant reduction from the previous year's crop. Total production in 1985 was 1.92 billion pounds, an 11 percent decline from the record high 2.16 billion pounds harvested in 1984. The decline was from a combination of both acreage and yield reductions. Harvested acres, at 593,000, declined 47,000 acres from the previous year, while the average yield, at 3,240 pounds per acre, was off 135 pounds per acre from the record setting 3,375 pounds per acre in 1984. The 1985 yield was still very respectable, ranking fourth highest in the State's history. Despite the reduction in overall production, Georgia still kept a firm grip on the distinction of being the nation's top peanut state. About 32 percent of the total value of all crop production in the State, was attributable to peanuts.

CORN YIELD SECOND HIGHEST

Corn acres harvested for grain was down 1 percent to 975,000 acres, the third smallest since records began in 1866. Even so, corn production, at 81.9 million bushels, was up 1 percent, thanks to a higher yield. The 1985 yield averaged 84 bushels per acre, up 2 bushels per acre from 1984 and the second best yield ever recorded for the state. Part of the credit for the higher yields in recent years is the increasing proportion of the crop grown under irrigation. The overall value of the corn crop, at $213 million, fell 12 percent despite the increase in production. The reason for the decline was a 13 percent, or 39 cent reduction in the price per bushel. The average price for 1985 was $2.60 per bushel. Corn accounted for 16 percent of the value of all crops.

SOYBEAN ACRES OFF 22 PERCENT

Acres harvested for beans in 1985 in Georgia dropped 22 percent to 1.55 million acres. Production, at 37.2 million bushels, was off only 7 percent, thanks to a 4 bushel improvement in yield, to 24 bushels per acre. Value of production fell 25 percent, to $179 million dollars. The major contributor in the value loss was a 19 percent reduction in price, which averaged $4.80 per bushel, down $1.16 from the 1984 average.

TOBACCO YIELD RECORD HIGH

The average yield for Georgia's 1985 tobacco crop, at 2,280 pounds per acre, surpassed all previous yields dating back to the beginning of records in 1909. However, the record yield only partially offset a 5 percent reduction in acreage. The 36,000 acres harvested produced 82.1 million pounds, down 4 percent from 1984. The average price declined 6 percent to $171.10 per cwt. The combination of production and price reduction lowered the total value of the crop 10 percent to $140 million. Value of production of tobacco accounted for 11 percent of the value of all crops.

COTTON ACRES JUMP 46 PERCENT

Georgia's cotton acres planted jumped 46 percent in 1985 to 255,000 acres. Harvested acres totaled 245,000 and yielded 725 pounds per acre, second only to the previous year's record yield of 784 pounds per acre. The expanded acreage and the good yield combined to lift production to 370,000 bales, a 32 percent increase. Value of the crop, at $103 million, was up only 17 percent, however, due to a weaker average price which declined 7 percent to $54.10 per cwt. Cotton contributed about 8 percent of Georgia's total crop value in 1985.

HAY TONNAGE OFF 6 PERCENT

Hay, like several other Georgia crops, experienced a decline in acreage, production, and price in 1985 but achieved an improvement in yield. Acres harvested, at 495,000, declined 10 percent but yield improved slightly to 2.5 tons per acre. Total production was 1.24 million tons, down 6 percent. The average price of $60.00 per ton, was off $2.00 per ton from 1984. This resulted in a 9 percent reduction in overall value of the hay crop to $74.3 million or about 6 percent of the value of Georgia crops.

1/ Data as obtained from area frame samples. These data do not represent official estimates of the Agricultural Statistics Board but provide raw data as obtained from survey respondents. The purpose of these data is to portray trends in soybean production practices.

Georgia farmers harvested 1,550,000 acres of soybeans in 1985.

FRUITS AND NUTS

HIGHLIGHTS

Georgia's fruit and nut producers faced another difficult year weather-wise in 1985. In fact, only the 1984 fruit crops escaped significant weather damage during the 1982-85 year period. Problems began in January for the 1985 crops when a wave of record cold weather pushed across the State. Serious bud loss occurred to peaches and apples in north Georgia. Two later heavy frosts during or after full bloom did additional damage to surviving blooms. Many pecan growers said they were not fully aware of the severity of the January freeze until near or at harvest when they discovered a lighter than normal set of pecans in the tops of their trees. Harvesting progress went faster than normal for peaches and apples due to the lack of north Georgia fruit. Two hurricanes interferred with the pecan crop. Hurricane Elena brushed the Florida panhandle and caused heavy rain and some wind damage to groves in south Georgia. Hurricane Kate arrived during the third week of November, the latest date ever recorded for a hurricane in Georgia, and did considerably more damage than her earlier sister. In addition to the frequent and heavy rainfall from mid-October to mid-December, temperatures were record high for the month of November. The combination of warmth and humidity caused rapid deterioration in quality of later harvested pecans, some to the point that they were not harvested at all.

PECAN CROP DOWN 31 PERCENT

Georgia's 1985 pecan crop of 83 million pounds was 31 percent less than the 120 million pounds produced in 1984. This was the lowest production recorded since 1979's production of only 65 million pounds. Until November, the September 1 pecan crop forecast of 105 million pounds seemed in line in spite of the January freeze. With one-fourth of the nuts harvested by November the weather turned for the worst. The combination of very warm temperatures and high moisture conditions caused rapid deterioration of the quality of any nuts on the grounds just prior to and after Hurricane Kate. Both shelling percentage and grade fell after growers were able to resume harvest. Despite the adverse conditions, Georgia remained the leading producer recording 34 percent of the 1985 national output compared with 52 percent of the 1984 national production.

The average price received by Georgia growers for their 1985 pecans was 68.4 cents per pound, up 13.1 cents per pound from 1984. This was the third highest price on record, surpassed only by 1980's average price of 78.4 cents per pound and 1976's record high of 81.5 cents per pound. The impact of low production but higher price dropped the value of the crop to $56.8 million. This was 15 percent below 1984 and 10 percent below 1983.

PEACH CROP DOWN 38 PERCENT, PRICE UP

Georgia's utilized (sold or used) peach production was down 38 percent from 1984's 134 million pounds. The hard January freeze killed many dormant peach buds in the northern part of the State. Additional damage from two other spring freezes during and/or after the bloom stage throughout the State also damaged the crop. All other southern states except Texas also suffered drastic production drops. The supply of peaches for the fresh market was short. This led to a dramatic averge price increase to 24.6 cents per pound. This was 66 percent over 1984's 14.8 cents per pound and the second highest price of record. The higher price per pound pushed value of production to $20.4 million, 3 percent above 1984's $19.9 million.

APPLE PRODUCTION PLUMMETS

Georgia's utilized production of apples from the 1985 crop totaled 19.0 million pounds. This utilization was only 42 percent of the 1984 crop utilization but equal to 1983. Total production at 20.0 million pounds was only 40 percent of the 1984 crop.

Average price for 1985 at 11.2 cents per pound was 2.8 cents per pound or 33 percent more than 1984. Overall value of the 1985 crop fell to $2.13 million, 43 percent below 1984.

GRAPE PRODUCTION FALLS 19 PERCENT

Grape production in Georgia fell the least of all fruits in 1985, dropping 19 percent to 2,100 tons. The fall was mainly due to late spring freezes and a rainy July that hampered spray programs. The average price received for all grapes (both fresh and processed grapes) was $494 per ton, a 15 percent drop. The blending of the low production and low price dropped the value of production 31 percent to $1.04 million.

Grape production is expected to expand in the next few years in Georgia. Interest in grape production for wines continues high.

POULTRY

POULTRY HIGHLIGHTS

The value of production from all chickens including broilers, eggs, and turkeys amounted to $1.08 billion for the 1985 production year, down 11 percent from 1984. Value of production from broilers totaled $796.4 million, down 3 percent from 1984. Georgia was second to Arkansas in value of production for broilers. Total egg production declined 4 percent to 4.28 billion eggs in 1985 compared with 4.47 billion eggs produced in 1984. All eggs value of production for 1985 dropped 27 percent from the previous year, to $235.5 million. The drop in average price received and the lower egg production both contributed to the decline in value. However, turkey value of production, at $35.1 million, showed a 2 percent increase over 1984.

BROILER PRODUCTION

Georgia growers produced 677.2 million broilers in 1985, the third consecutive year of record high numbers. Production increased 6 percent from the 636.8 million broilers produced in 1984. Pounds produced in 1985 totaled 2.84 billion, a 9 percent increase from 1984's 2.60 billion pounds. The average live weight was 4.20 pounds in 1985 compared with 4.10 pounds per bird in 1984. Georgia ranked second to Arkansas in the number of broilers produced and accounted for about 15 percent of the nation's total broiler production.

The number of spent hens sold from Georgia's laying flocks totaled 17.5 million in 1985, down 7 percent from the 18.8 million sold in 1984. A total of 694.7 million spent hens and broilers were sold for slaughter in 1985, up 6 percent from the previous year. The average price received for broilers in 1985 was 28.0 cents per pound, 4 cents below last year's record high, but still the second highest on record. The average price received for spent hens was 17.5 cents per pound, down from the record high 20.5 cents per pound in 1984. This was also the second highest average price on record.

EGG PRODUCTION

Eggs produced in Georgia for the year ending November 30, 1985, totaled 4.28 billion, 4 percent less than the 4.47 billion eggs produced in 1984 and 8 percent less than the 4.67 billion in 1983. The number of layers averaged 17.6 million in 1985, 1 million less than the 18.6 million layers the previous year. In hatching egg flocks, the average number of layers was up in 1985 to 5.30 million from 5.09 million in 1984. Average number of layers in table egg flocks dropped for the sixth consecutive year to 12.3 million in 1985 from 13.5 million in 1984. All layers in Georgia produced an average 243 eggs per hen in 1985, 3 eggs more than 1984. Hatching egg flocks produced 1.19 billion eggs during 1985, an increase of 3 percent from the previous year. Table egg flocks produced 3.09 billion eggs in 1985, 7 percent less than 1984.

The sale of table eggs and hatching eggs used as table eggs contributed 54 percent of the total egg cash receipts in 1985. Hatching eggs made up the other 46 percent. In 1984, table eggs made up 64 percent of cash receipts and hatching eggs the other 36 percent. The large shift from 1984 to 1985 resulted from an increase in the number of hatching eggs sold and a smaller price decrease of hatching eggs. The average price for all eggs in 1985 was 66.0 cents per dozen, 20.2 cents per dozen less than 1984. Table egg prices averaged 47.7 cents per dozen, down 24.6 cents from the previous year. Georgia's total egg production was 72 percent table eggs and 28 percent hatching eggs.

Georgia ranked fourth in the nation in 1985 in both the average number of layers and in total egg production. California was the leading state in layers and egg production, followed by Indiana and Pennsylvania. Georgia ranked third in value of eggs produced behind California and Indiana in 1985.

TURKEY PRODUCTION

There were 2.63 million turkeys produced in Georgia during 1985, up 2 percent from the 1984 production of 2.58 million. Turkey production in 1985 was 74.7 million pounds, compared with 72.0 million pounds produced in 1984. This was a 4 percent increase from the 1984 production and 24 percent more than 1983. Only heavy breed turkeys are produced in Georgia.

Turkey value of production in Georgia was $35.1 million in 1985, a 2 percent increase from 1984. Average price per pound slipped 1 cent to 47.0 in 1985.

1/ Queen bees sold individually. 2/ A queen bee included in each package. 3/ Estimates not made in 1982.

Georgia farmers raised 2,631,000 turkeys in 1985, 2 percent more than in 1984.

LIVESTOCK AND DAIRY

LIVESTOCK AND DAIRY HIGHLIGHTS

The number of cattle in Georgia on January 1, 1986 dropped to 1,700,000 head, the lowest level since 1980. End of the year hog numbers declined for the sixth consecutive year and was less than half the 2,360,000 head on hand December 1, 1979. Despite the drop in 1985 inventory, prices for both cattle and hogs failed to improve. Beef cattle prices averaged $43.50 per cwt. compared with $44.10 in 1984. All hogs averaged $44.70 per cwt. during the 1985 marketing year, $1.10 per cwt. less than 1984.

Georgia ranked 25th nationally in the number of cattle and calves on January 1, 1986, and ranked 13th in the number of hogs and pigs on December 1, 1985. The number of cattle operations in Georgia in 1985 totaled 37,000, the same as 1984. Hog places numbered 11,000 in 1985, compared with 13,500 in 1984.

Milk produced in Georgia in 1985 totaled 1.30 billion pounds, 2 percent more than the 1.27 billion pounds produced in 1984. Georgia ranked 26th in the nation in the pounds of milk produced. The number of operations with milk cows in 1985 totaled 2,200, a decline of 300 from 1984. Cash receipts for dairymen and livestock producers amounted to $603.3 million in 1985, 1 percent more than the previous year.

CATTLE

All cattle and calves on Georgia farms on January 1, 1986, totaled 1,700,000 head, 3 percent less than the previous year's total of 1,750,000. Beef cows dropped 3 percent to 751,000, but milk cows were up 1 percent to 118,000. Cash receipts from the sale of cattle and calves in 1985 rose 16 percent to $224.4 million. The average price for cattle was down from 1984, but increased marketings of both cattle and calves and an increase of $5.10 per cwt. in the average price for calves, resulted in the improved cash receipts.

The value of the inventory on January 1, 1986 for all cattle and calves was $510 million, down 6 percent from a year earlier. This was the third straight decline in value and the lowest since 1979. Average value per head on January 1, 1986 was $300, compared with $310 on January 1, 1985.

The 1985 calf crop totaled 780,000 head, equal to the 1984 calf crop. Morgan county maintained the lead in number of cattle and calves with 35,000 head on January 1, 1986. Colquitt county followed with 32,000 head and Mitchell county was third with 31,000 head.

HOGS

The Georgia inventory of all hogs and pigs on December 1, 1985, was estimated at 1,150,000 head, 4 percent less than a year earlier. This was the lowest inventory since estimates began in January 1867. Breeding stock, however, was slightly higher than the previous year, at 165,000 head. The total value of the hog inventory on December 1, 1985, was $72.5 million, a drop of 9 percent from a year earlier. The average value per head was $3.00 less than 1984. Cash receipts from the sale of hogs in 1985 totaled $196.4 million, down 10 percent from 1984.

Producers had 259,000 sows to farrow from December 1, 1984, through November 30, 1985. This was 8 percent less than the 283,000 sows farrowing the same period the previous year. Total pigs saved during this period totaled 1,892,000, resulting in an average of 7.31 pigs per litter. Colquitt county continued as the leading county in total hogs and pigs with 63,000 head, followed by Brooks county with 52,000.

MILK PRODUCTION

Georgia's 1985 milk production was up 2 percent to 1.30 billion pounds, but the annual average number of milk cows dropped 2 percent to 117,000 head. This was the first annual increase in milk production since 1982. The annual average production per cow, at 11,128 pounds, increased 5 percent from 1984. Cash receipts from marketings totaled $182.6 million in 1985, 1 percent less than the previous year. Milk prices averaged $14.10 per cwt. in 1985, compared with $14.60 per cwt. in 1984. Putnam county was the leading county in the number of milk cows on January 1, 1986, with 9,700, followed by Morgan county with 9,500.

RED MEAT PRODUCTION

Slaughter plants in Georgia produced 378.3 million pounds of red meat (beef, veal, pork and mutton) during 1985, a decrease of 10 percent from 1984.

The number of hogs slaughtered in Georgia in 1985 totaled 1.57 million head, 16 percent less than in 1984. Cattle slaughter amounted to 245,600 head in 1985, up 1 percent from 1984. Calves slaughtered totaled 10,900 in 1985, a drop of 36 percent from the previous year.

FARM INCOME, PRICES AND EXPENSES

1985 HIGHLIGHTS

Georgia farmers' gross farm income for 1985 fell 9 percent to $3.81 billion. Despite the drop, 1985's gross farm income still ranks as the second highest of record. Farm production expenses decreased 5 percent in 1985 to $2.90 billion. Net farm income, at $909.4 million, was down 21 percent from 1984 but still the second highest of record.

All major income categories in 1985, except machine hire/custom work and other farm related income, were below 1984. The largest drop dollar-wise occurred in farm marketings which fell $293.1 million or 8 percent. Value of farm inventories declined $19.1 million during 1985 compared to a $35.4 million increase in 1984.

1985 CASH RECEIPTS

Georgia farm products sold during 1985 including government payments generated cash receipts of $3.5 billion, down 8 percent from 1984. Crops accounted for 45.8 percent of the total. Poultry accounted for 31.2 percent of the total with livestock and livestock product sales making up 18.2 percent.

Crop cash receipts totaled $1.6 billion in 1985, down 10 percent from 1984. Peanut receipts valued at $514 million, accounted for 14.7 percent of the total cash receipts. Soybean receipts, at $185 million, fell 35 percent from 1984. Corn cash receipts, at $151 million, were up 12 percent.

Poultry cash receipts in 1985 totaled $1.09 billion, down 10 percent from 1984. Broilers earned $796 million or 22.8 percent of the total to again rank as the leading gross sales enterprise in Georgia. Eggs ranked in third place among all commodities with cash receipts of $235 million, down 27 percent from 1984.

Livestock cash receipts in 1985 totaled $637 million, up 1 percent from 1984. Cattle and calves receipts valued at $224 million, rose 16 percent from 1984. Hogs receipts at $196 million were down 10 percent.

Farm forest products and government payments, at $98 million and $71 million respectively, accounted for 4.8 percent of the total.

PRICES RECEIVED BY GEORGIA FARMERS

Prices received by Georgia farmers were generally depressed for 1985 in comparison to the previous year. Only calves, pecans, peaches and apples showed increases from 1984.

Prices for field crops were all well below a year earlier. Corn, for the 1985 marketing year, averaged $2.55 per bushel, down 44 cents from the 1984 season average and the lowest price since 1978. Soybeans were down $1.11 per bushel to $4.85 per bushel, the lowest since 1973. Peanuts for the 1985 marketing year averaged 21.7 cents per pound, down 7.1 cents per pound and the lowest price since 1979. Tobacco at $1.711 per pound was down $.115 per pound for the lowest price since 1981. The average price received for cotton was down 7 percent and cottonseed was down 39 percent from the previous year.

Broiler price at 28.0 cents per pound was 4.0 cents lower than 1984 but still the second highest of record. The all egg price averaged 66.0 cents per dozen, 20.2 cents below a year earlier. Season average milk price dropped 50 cents per cwt. from 1984 to the lowest price since 1980. Milk cow price was unchanged. The average all hog price at $44.70 was $1.10 per cwt. below 1984. Barrows and gilts were down $1.90 to $45.10 per cwt. The average price for beef cattle at $43.50 per cwt. was 1 percent below 1984. Steers and heifer prices dropped 40 cents from 1984 to $51.00 per cwt. Calf prices rose 10 percent to $56.30 per cwt.

Pecans at 77.9 cents per pound were 22.6 cents higher than 1984 and the highest since 1980. Apple prices jumped 33 percent to 11.2 cents per pound, well above the 8.4 cents per pound for 1984. Peaches, at 24.6 cents per pound, were 9.8 cents higher than 1984.

1985 FARM PRODUCTION EXPENDITURES

Farm production expenditures totaled $2.90 billion for Georgia in 1985, 5 percent below the $3.04 billion of 1984. The 1985 farm production expenses were the lowest since the record high of $3.27 billion in 1981. Of the 16 categories, expenditures increased in 5 while 11 declined. Items that increased included business taxes at $72.0 million, up 9 percent; livestock purchases at $143.8 million, up 8 percent; and cash wages at $164.6 million, up 5 percent from a year ago. Pesticides at $129.4 million were up 4 percent over 1984.

Feed was the largest expense item for Georgia farmers at $678.2 million and accounted for 23.4 percent of the total. In 1984, feed cost totaled were $666.8 million and represented 21.9 percent of the total.

Outlay for nonreal estate interest and net rent to nonoperators showed the largest decreases, down 26 percent from 1984. Real estate interest at $229.7 million was down 11 percent from 1984. Fertilizer and lime was 1 percent below 1984 at $210.6 million. Fuel and oil at $132.2 million was down 8 percent from the previous year. Repair and operation, electricity and seeds were down 4, 4 and 2 percent, respectively, from 1984.

PRICES PAID BY GEORGIA FARMERS

The average prices paid by Georgia farmers during 1985 for commodities and services showed mixed trends. Feed items which are Georgia farmers largest expense, were down for all items except turkey grower and stock salt, which were up 2 and 1 percent, respectively, from 1984. All other feed items ranged downward from 25 percent for 32% dairy feed and cottonseed meal to 1 percent for middlings.

Only two fertilizer items, 6-6-6 and nitrate of soda showed an increase of 4 and 2 percent, respectively. Other fertilizer items fell in price from 1 percent for 5-10-15 and anhydrous ammonia to 11 percent for superphosphate.

Farm machinery prices were down for large price ticket items; tractors, cotton pickers and combines ranging in price reduction from 1 to 10 percent below 1984. Smaller priced ticket items; disk harrows, cultivators and corn planters were up from 1 to 9 percent above the previous year.

Of the 11 building material items priced, 6 increased and 5 declined. Prices for farm supply items were all down except adjustable wrenches, up 5 percent; chain saws and acetylene welders which were up 4 percent. Of the 8 fencing material items priced, 4 were down and 4 were up. All seed prices were down from 1984. Of the 19 motor supplies and services priced, 2 were unchanged, 5 were down, and 12 showed an increase in price from the previous year. Of the 7 pesticide items priced, 3 were up in price ranging from 2 to 5 percent and 4 were down ranging from 4 to 10 percent below 1984.

GENERAL

WEATHER AND CROP SUMMARY, 1985

Georgia's 1985 climatological season commenced with record breaking warmth for the first couple of days in January followed by some all time lows. The extreme cold caused damage to some crops. By March, the weather had warmed and was dry--affording farmers an opportunity to prepare land, plant, and progress with outdoor work. April, like March, was dry and allowed field activities to be performed at or ahead of schedule. However, the lack of rain was becoming a concern. During May, temperatures were normal with sufficient time between rain periods to allow for land preparation and planting. Above normal temperatures and near or below normal rainfall in June kept irrigation systems busy. The wet month of July caused delays in harvest and difficulty in maintaining insect and disease control but was beneficial to most crops. August brought hurricanes, one at mid-month and one in late August-early September. The heavy rains associated with the hurricanes caused harvest delays, especially across south Georgia. High temperatures, in the 90's, in September helped dry the soil; and farmers were able to progress with harvesting but planting of small grains was slowed by dry soils. At the end of the month, rain set in and small grain planting moved rapidly ahead. October weather was quite variable. The rains late in the month slowed both harvest and small grain seeding. Rains in November continued to slow harvest. The heavy rains and the high winds of Hurricane Kate later in the month not only stopped field work but damaged crops. Some areas lost pecan trees. Nuts remaining for harvest had a rapid quality loss. Soybeans and cotton suffered quality and yield loss. Wet soils during December continued to delay harvest. Quality problems for soybeans, cotton and pecans continued.

JANUARY

Record warmth occurred during the first two days of January. During the remainder of the month, all time low temperature records were set at many locations. Readings were below zero as far south as Tifton and Claxton. Minimums of 3 degrees were recorded to the Florida border. Blairsville had a minimum temperature of 16 below zero on the 21st. Temperatures during the month averaged 5 to 10 degrees below normal. Precipitation totals were mostly in the two and three inch ranges which is about half of the usual January amount. The driest section of the State was east Georgia. Some of the precipitation in the Georgia mountains was in the form of snow. The average temperature statewide for January was 40.0 degrees, 6.0 degrees below normal. Precipitation for the State averaged 3.37 inches, 1.31 inches below normal. The colder temperatures increased peach chill hours but killed some peach buds. During the latter part of the month, temperatures were extremely cold and caused damage to peaches, pastures, small grains and other crops. Part of the onion crop had to be replanted. The main activities were land preparation, as weather permitted, and tobacco bed preparation in the southeast and southcentral.

FEBRUARY

Temperatures in February averaged near normal. However, temperatures were below normal the first half of the month and above normal the last half of the month. Temperature extremes were 85 degrees at Bainbridge and 7 degrees at Blairsville. Below freezing temperatures occurred on 10 days in the south and 15 to 20 days in the north. Rainfall totals were 1 to 3 inches in the southeast and mostly 5 to 7 inches elsewhere with local totals to 9 inches. In late February, mean four inch soil temperatures were averaging near 50 degrees in the extreme north to the mid 60's over southeast Georgia. These soil temperatures were 5 to 10 degrees above normal. Georgia precipitation averaged 5.36 inches, .81 inches above normal for the month. Temperatures in the State averaged a normal 48.0 degrees. Rain and cold weather hampered field activity early in the month. Farmers were busy preparing land and applying nitrogen fertilizer to small grains. Tobacco plants were in fair condition and corn planting got underway in the southwest part of the State at the end of the month.

MARCH

March was a warm and dry month across Georgia. Rainfall totals averaged 1 to 2 inches in the north and central parts of the State and 3 to 4 inches in the south. However, extreme south central counties reported 4 to 6 inches of rain, most of it falling on March 16. These rain totals were 4 to 6 inches below normal over the north and 2 to 4 inches below normal over the south. March temperatures averaged 3 to 5 degrees above normal. Much of central and south Georgia reported maximum temperatures in the mid and upper 80's late in the month. Freezing temperatures the morning of March 19th were nearly statewide. The coldest temperature was 16 degrees at Blairsville. Mean four inch soil temperatures at late March were averaging near 60 degrees in the north to near 70 degrees in the south or 5 or 10 degrees warmer than normal. The average temperature in March was 58.0 degrees, 2.8 degrees above normal. Rainfall in the State averaged 1.73 inches, 3.86 inches below normal for the month. . Land preparation, planting corn, watermelons, and transplanting tobacco along with other field and outdoor work made rapid progress across Georgia as March was generally a warm and dry month. Corn was almost three-fourths planted by the end of the month, far ahead of 1984 and average. Tobacco transplanting and watermelon seeding were also far ahead of normal.

APRIL

Like March, rainfall totals in April were much below normal across most of Georgia. Much of the State received only 1 to 2 inches of rain in April with local totals to 3 inches mainly over the north. Rainfall totals since January 1st were 5 to 10 inches below normal over most of Georgia. Temperatures in April averaged near normal. However, a cold spell around the 10th of the month produced minimum temperatures from the upper teens in the mountains to the 30's over the central and south. Above normal temperatures prevailed late in the month with maximum temperatures in the low 90's common over portions of central and south Georgia. Temperature extremes for the month were 18 degrees at Clayton and 94 degrees at Savannah. Mean four inch soil temperatures at late April were averaging from the low and mid 70's over the north to the low 80's across central and south Georgia. These soil temperatures are normally more characteristic of mid to late May. Temperatures for the State averaged 64.0 degrees, 1.3 degrees above normal for the month. Rainfall over the State averaged 2.01 inches, 2.17 inches below normal. Dry weather in April allowed land preparation, spring planting and other field work to be at or ahead of schedule. Below freezing temperatures on April 8 and 9 caused further damage to the State's peach crop already hurt by the record January cold. However, short soil moisture supplies were a major concern much of the month. Hessian fly damage to wheat was reported in a large part of south Georgia.

MAY

Rainfall during May varied widely. Rain fell on 7 to 14 days in the north and 6 to 10 days in the central and south portions of the State. Totals ranged from 2 to over 6 inches. These totals ranged from 2 inches below normal to 2 inches above normal for the month. Total rainfall since January 1, was 2 to 10 inches below normal at almost all locations. Average temperatures during May were near normal. Extreme high temperatures were in the upper 80's in the north to mid and upper 90's in the central and south. Afternoon temperatures were above 90 degrees on 3 to 10 days in the central and southern portions of the State. Average rainfall for Georgia in May was 4.05 inches, .30 inches below normal. Temperatures for the State averaged exactly normal for the month. There was enough time between rain periods during the month to allow land preparation and planting to be at or well ahead of schedule. Soil moisture supplies were low at the beginning and at the end of the month but mostly adequate the middle of the month. Wheat harvest started a little slower than average but quickly jumped ahead of the normal pace by the end of the month. Peach harvest began on schedule in early May and maintained normal progress during the month. By the end of the month, crop development was ahead of normal for all crops. Field work consisted of irrigating, haying, planting, spraying for weeds and insect control and harvesting peaches, tobacco and watermelons.

JUNE

The month commenced with light and widely scattered rainfall. Afternoon temperatures were above 100 degrees 3 to 6 days in the central and south. More frequent and heavier rain fell during the last half of the month with temperatures closer to the seasonal normal. Average temperatures for the month were near normal in the extreme north and mostly 1 or 2 degrees above normal elsewhere. Rainfall totals for June ranged from 1 to 5 inches in the north and central areas with 3 to 8 inch totals more common in the extreme south. These totals were 1 to 3 inches below normal except over the extreme south where totals were 1 to 3 inches above normal. Overall rainfall totals since January 1 were still 3 to 12 inches below normal at almost all locations. Precipitation averaged 3.73 inches for the month, .60 inches below normal. At the end of the month, soil moisture supplies were again quite low. The average temperature for Georgia was 78.0 degrees, .8 degrees above normal. The record setting heat and very dry weather of early June caught about two-thirds of the State's corn crop in the critical silking stage. Cooler temperatures and statewide rains around mid-month came too late for some dryland corn. Planting progress for soybeans and grain sorghum ran ahead of normal all month and by the end of the month plantings were over 90 percent complete. Small grain harvest progressed steadily during the month and was virtually complete by the end of the month.

JULY

July was a wet month on most Georgia farms with above normal rainfall recorded. Some areas had several inches more rain than normal with a few locations reporting over 5 inches more than normal. Rainfall totals were generally in the 5 inch range with 6 and 7 inch totals common. Rain fell on about 14 days. The driest area of the State was near the coast where rainfall totals were under 5 inches, several inches below normal. Temperatures averaged near to slightly below normal in most areas. Maximums reached 100 degrees at several locations with readings of 90 degrees or above on about 10 days in the north and 22 days over central and southern counties. Lowest readings were in the lower 50's in the mountains and in the mid 60's elsewhere. Average daily pan evaporation rates were near .22 inches. Precipitation for the month averaged 6.89 inches, 1.55 inches above normal. The average State temperature was 78.0 degrees, .8 degrees below normal. Frequent and heavy rains the last third of July caused numerous delays in the harvesting of hay, corn, tobacco, fruit, vegetables and other crops. Insects, weeds and plant diseases showed major increases due to the inability to maintain adequate control programs. Soil moisture supplies in most areas were adequate to surplus at the end of July.

AUGUST

Temperatures during August averaged 1 to 3 degrees cooler than normal over most of Georgia. Maximum temperatures for the month ranged from near 90 in the mountains to the mid and upper 90's over the central and south. Temperatures of 90 degrees or above occurred on 5 days over the north and 16 to 22 days over the central and south. Temperature extremes were 100 at Albany on the 21st and 47 degrees at Clayton on the 5th. Rain totals were mostly 4 to 7 inches over the north and central with local totals exceeding 10 inches over the south. Much of the rain over the north was associated with the remains of Hurricane Danny at mid month. Hurricane Elena produced locally heavy rains over the extreme south in late August and early September. One of the driest portions of the State was in the Athens to Augusta area where rain totals in August were mostly in the 2 to 3 inch range. Daily open pan evaporation averaged .22 inches. Rainfall in August averaged 6.07 inches, 1.37 inches above normal. The average temperature for the month was 78.0 degrees, .8 degrees below normal. Rains that continued through mid August greatly curtailed field work. Corn and tobacco harvest continued to run behind normal. Peanut harvest got off to an early, fast start but harvesting operations about ground to a halt at the end of the month due to a period of heavy rains associated with Hurricane Elena. Harvesting delays also occurred in corn and sorghum. Insect control was active all month in soybeans, cotton, peanuts, and grain sorghum and was made more difficult by the frequent rains. Boll rot and boll lock were common problems in cotton.

SEPTEMBER

Above normal temperatures prevailed across Georgia the first 10 days of September with maximum temperatures above 90 degrees almost each day over the central and south. A high of 99 was reported at Augusta on the 9th. Much cooler weather prevailed the remainder of the month as frontal passages became more frequent. Lowest temperatures ranged from the 30's in the mountains to the 40's and 50's elsewhere. Temperatures averaged 1 to 3 degrees cooler than normal. Nearly all of Georgia received less than 1 inch of rain. The exception was over the extreme southeast with 4 to 5 inches of rain at Waycross and Brunswick. Temperatures for the month were cooler than normal averaging 73.0 degrees, 2.3 degrees below normal. Rainfall was a sparse 1.18 inches, 3.04 inches below normal. Dry weather in September allowed Georgia farmers to make rapid progress with most row crop harvesting and other field work. However, low soil moisture supplies the latter part of the month sharply curtailed seeding of small grains and winter pasture. The dry weather caused a sharp drop in the condition rating of soybeans.

OCTOBER

The month turned out to be warm with temperatures averaging 5 to 7 degrees above normal. However, a brief cold spell occurred at the end of the first week with minimum temperatures near freezing across the mountains and in the low to mid 40's over most of the remainder of the State. Maximum temperatures of 90 or above occurred on 5 to 8 days across southwest Georgia during the month. Rainfall totals were mostly 2 to 5 inches. However, portions of southeast Georgia reported over 5 inches of rain while a few areas of central and south central Georgia received less than 2 inches of rain. Most of the rain fell during the first and last week of the month. Rainfall averaged 4.75 inches, 2.15 inches above normal. Temperatures averaged well above normal at 69.0 degrees, 5.1 degrees on the plus side. Dry weather during much of October allowed most farmers to complete corn, peanut and apple harvesting and proceed with other field work. However, a wet weather pattern at the end of the month slowed cotton and soybean harvesting as well as other field work. Warm and dry soils hindered small grain seeding during much of October. Beneficial rains for seeding small grains and winter pastures fell late in October.

NOVEMBER

Average temperatures for the month were 8 to 11 degrees above normal. Rain fell on 10 to 13 days in the north and east and 6 to 10 days elsewhere. Rainfall totals in November were mostly between 2 and 6 inches with local totals between 8 and 10 inches. These totals were 1 to 4 inches above normal except for the southwest where totals were 5 to 7 inches above normal and the northwest where totals were near normal. November started off cool. Lows cooled into the 20's and 30's in the extreme north with mid and upper 30's in the central and south. Temperatures warmed to above normal for the remainder of the month. Afternoon highs warmed into the mid and upper 70's in the north with mid and upper 80's in the central and south. Overnight lows were mostly in the 50's in the north to 60's elsewhere. Rainfall increased considerably over the central and southwest as Hurricane Kate passed over south Georgia during the third week of November. The last week of November remained warm, and weak fronts brought additional rain. Georgia rainfall averaged 5.34 inches, 2.36 inches above normal. Temperatures, at 63.0 degrees, averaged 9.2 degrees above normal. Row crop harvest and other field work made good progress across the State during the middle part of November. However, delays were much more frequent during the last part of the month when harvesting and tillage operations slowed to a crawl. Seedings of small grains and winter cover crops continued behind normal. Soil moisture was adequate to excessive over a good portion of the State, especially at the beginning and end of the month.

DECEMBER

Temperatures during December averaged three to five degrees colder than normal across Georgia. The coldest temperatures occurred Christmas night with lows ranging from the single digits in the mountains to the mid and upper teens in the extreme south. Maximum temperatures in the upper 70's occurred over south Georgia on the first day of December. Mean four inch soil temperatures at late December were averaging in the upper 30's in the north to near 50 degrees in the south which was near normal. Rainfall in December averaged 2.96 inches, 1.21 inches below normal. Temperatures also averaged below normal at 44.0 degrees, 3.8 degrees on the minus side. Rains during the month further delayed planting of small grains and harvest of crops. Many of the soybeans harvested during December suffered serious quality loss and many fields were abandoned due to poor quality. Harvest progress for soybeans was far behind normal all month. Cotton and peanuts also suffered yield and quality losses but harvest was only slightly behind normal for pecans and moderately behind normal for cotton.

1/ Beginning in 1985, Farm Labor data published regionally. The Southeast region includes GA, AL, and SC. 2/ Quarterly estimates discontinued after April 1981. Estimates made annually in 1982-83; current program is for estimates in Apr., July, and October. 3/ Excludes agricultural service workers. 4/ Includes only family members who worked 15 hours or more during survey week without receiving cash wages. 5/ Classification includes machine operators, bookkeepers, buyers, etc. 6/ Includes wages based on salary or commission paid by day, week, etc. 7/ Insufficient data, included in all hired wage rates.

ESTIMATES ISSUED BY GEORGIA AGRICULTURAL STATISTICS

Current estimates of many data items included in this publication are available from the Georgia Agricultural Statistics Office, at various times throughout the year. The table below indicates the months data are available. Current data may be obtained by calling the Georgia Agricultural Statistics Office or interested persons may be added to one or more of our five mailing lists. The five separate mailing lists are: (1) Weekly Weather and Crops, (2) Weekly Broiler Report, (3) Georgia Agricultural Facts, (4) Georgia Poultry Facts and (5) Georgia Farm Report, a semi-monthly publication containing various crop, livestock, price, and other farm data. The annual charge for these publications is: Weekly Weather and Crops, $12; Weekly Broiler Report, $15; Georgia Agricultural Facts, $5; Georgia Poultry Facts, $5; and Georgia Farm Report, $10. Reports are available free of charge to farmers and agribusiness firms who provide the basic data on which reports are based. Within availability constraints, a copy of the Georgia Agricultural Facts and Poultry Facts is available to Georgia residents without charge. An order form may be obtained by calling (404-546-2236) or writing the Georgia Agricultural Statistics Office.
